## Do you have quality issues?

Are you getting too many returns from your customers and having hard to understand why? This can be a problem with your design or most likely that you have too many gaps in your production test system. It's important to have known test coverage and a test system that is reliable to be able to identify production issues.

## What we offer

At WireFlow we can go through your PCB design and create a test coverage report that identifies what needs to be tested on your product. Based on this report we can help you analyse if there are any gaps between the test coverage report and your test system.

If we find critical gaps you can update the test system yourself or we can help you out. We have customers today that we help updating their test systems built by themselves or by a third-party company.

For a low cost we can help you move away from customer returns and unknown test coverage.

**Unknown test coverage**  
**Costly returns**  
**Unreliable test system**

**Known test coverage**  
**Input for improvements**  
**Reliable test system**
